

## CUSTOM TESTING

- **Comparative Method Testing**
- **Surplus Sample Testing**

We manage the performance of specific tests on remnant samples provided by us or the diagnostic company.

A **comparison of methods** experiment is performed to estimate inaccuracy of systematic error. One performs this experiment by analyzing patient samples by the new **method (test method)** and a **comparative method**, then estimate the systematic errors on the basis of the differences observed between the **methods**.

This testing is available on a large option of instrument platforms.
